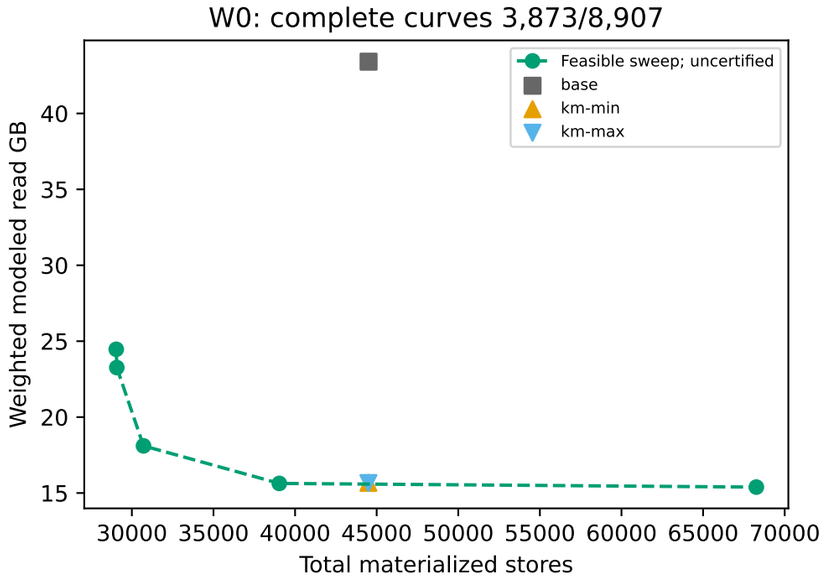
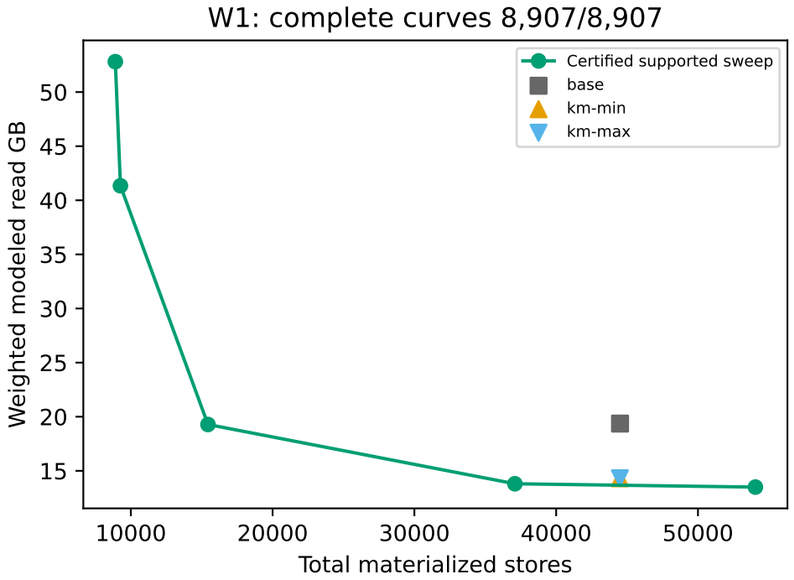
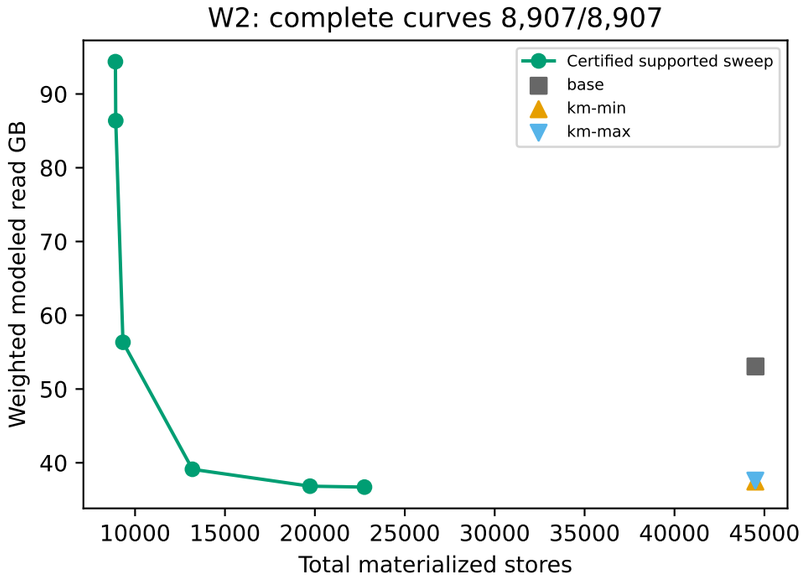
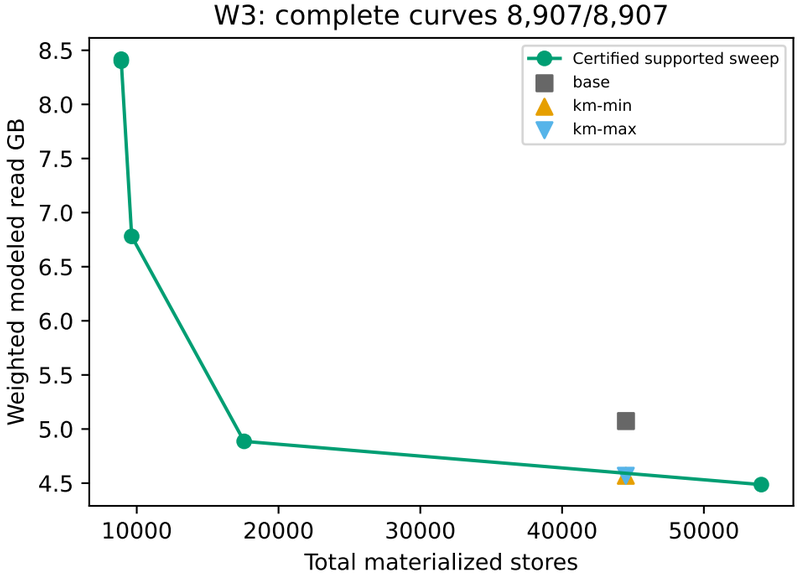
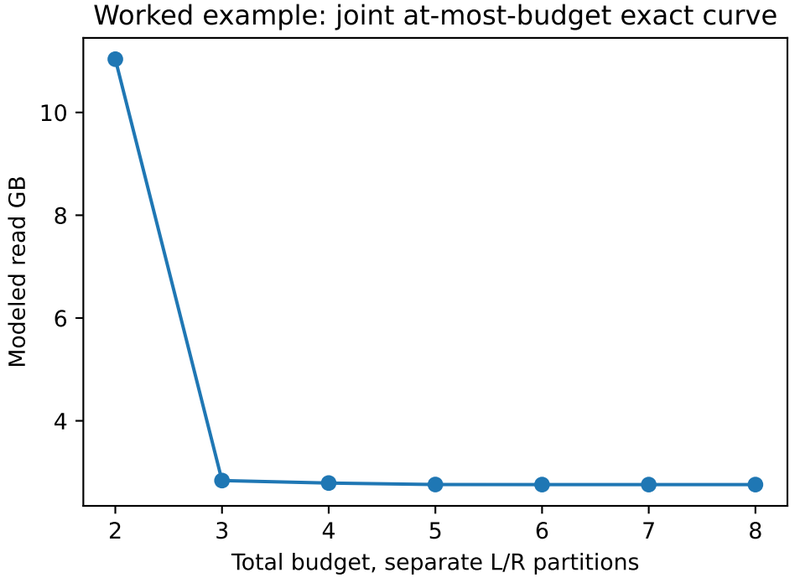
F15 · Stores versus modeled read bytes











Global certificate rules

- Every partition needs a complete exact curve.
- $\lambda \geq 0$ exposes supported efficient points.
- Unsupported budgets retain feasible upper bounds and certified lower bounds, when available.
- Incomplete terms supply no global certificate.

$\beta = \gamma = 0$ in the four real-data panels.
All other β strata are retained in the summary.

Full real population. Lines show evaluated nonnegative-multiplier points, not an assertion that every integer budget or the entire hull was solved.
