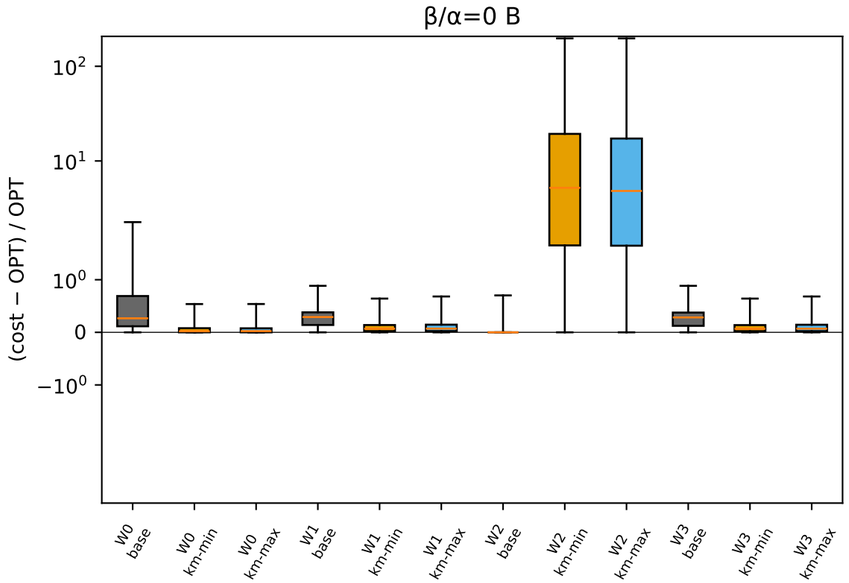
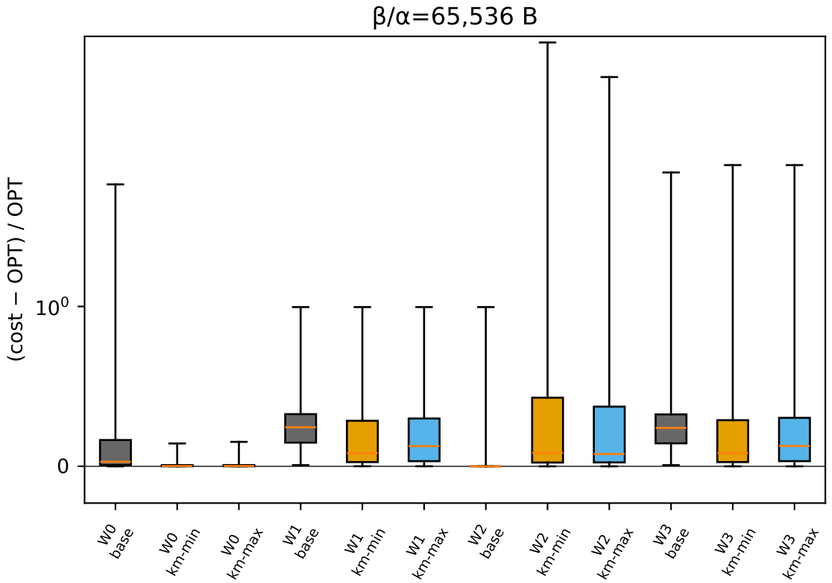
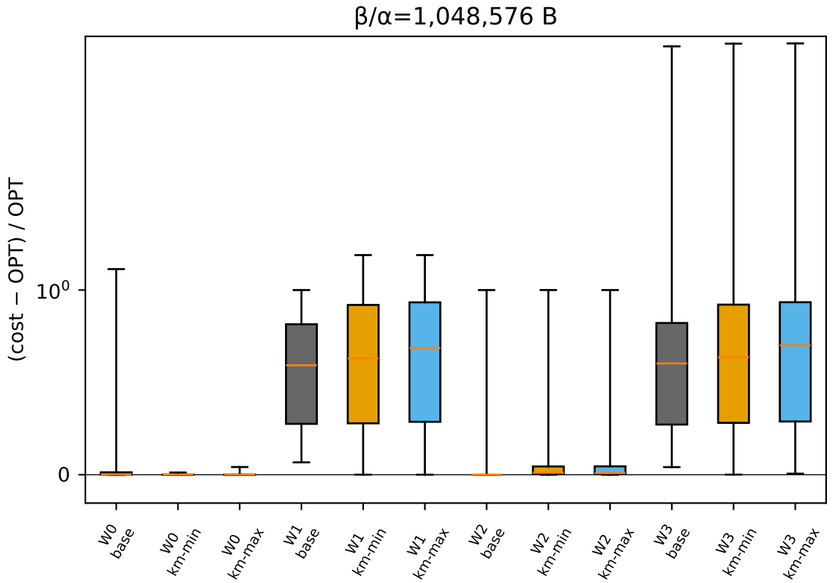
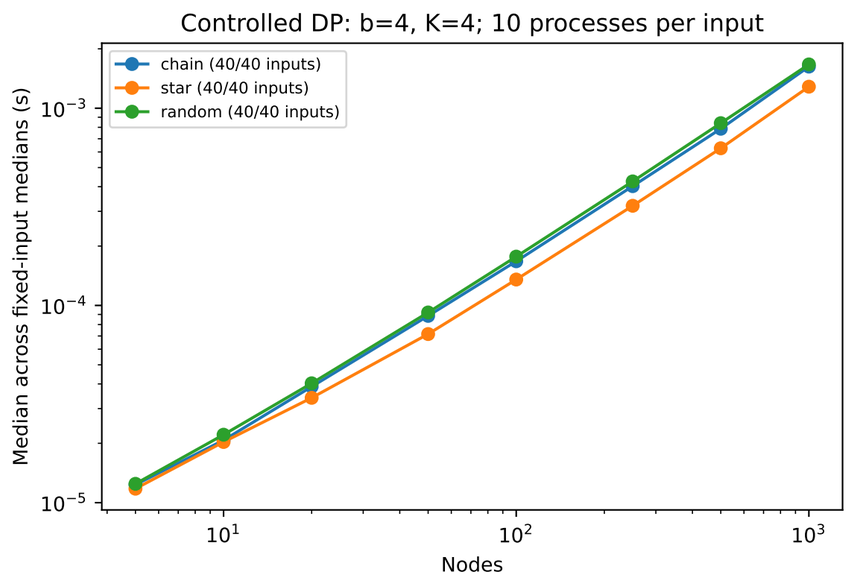
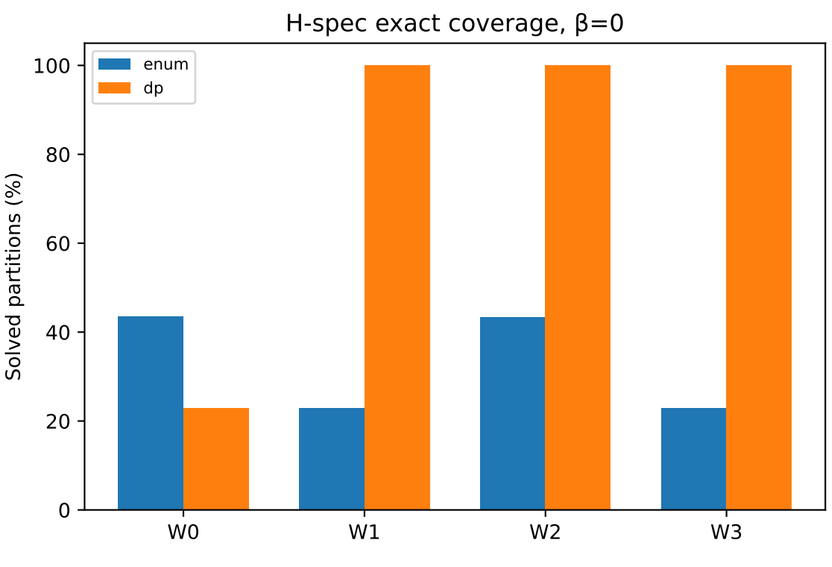
F16 · Exact optimality gaps, scaling and coverage











Gap scope

Boxes: 25th/50th/75th percentiles.
Whiskers: full observed min/max.
Only solved identical-budget cases enter gaps.
Zero OPT has no relative gap.

Runtime: saved warm-up +10 measured processes.
Points combine up to5 different tree inputs.
Only all10-solved inputs enter runtime points.
All cap outcomes and frequency flags are retained.

Per-input CIs and exact coverage by partitions,
bytes and active class weight are saved.

Modeled objective gaps; controlled solver timings remain conditional on this nonexclusive laptop. A cap result is never treated as an optimum or a solved runtime.
